DANGERS of COMPRESSED AIR

Many safety measures exist, but the risk around compressed air is often underestimated. Often workers use compressed air to blow their clothes and body dust-free.

In the mouth: lungs, stomach or intestines tear

Through the navel: intestines tear

In blood vessels in the brain: lead to death

Blowing out the eye

Many dangers from compressed air are the same as those associated with unsafe diving. High pressure can cause various serious conditions!

You put both yourself and your bystanders in danger! Therefore, the use of compressed air to blow off personnel is already **prohibited** in many places.

Safe alternative: JetBlack

ACI's JetBlack system is powered by a blower and delivers a large volume of air with a relatively low pressure.

This allows you to safely direct the JetBlack to any part of your body (except eyes and ears).

We also offer a **cleaning booth**. This allows you to safely and efficiently remove and collect dust.

Even more advantages...

Energy efficient

Quieter

The past five years, ACI sold in Europe:

10 000

JetBlacks

250

cleaning booths
